alert(document.getElementsByTagName('h1')[0].innerHTML) 1. Technical Field The present invention relates to a sewing machine. 2. Related Art There is known a sewing machine that has a sewing machine main body and a removable cover attached to the sewing machine main body (see Japanese Unexamined Patent Appl. Pub. JP-A-2010-007614, for example). The sewing machine main body is provided with a sewing machine body having a sewing needle, a stitch forming mechanism that forms a stitch by moving the sewing needle, a needle bar that supports and drives the sewing needle, a feed dog that feeds cloth, and a motor for driving the feed dog. The sewing machine main body is provided with a connection portion provided on the side of the sewing machine body that faces the removable cover and having a shape that can be received by a shape of the removable cover. The removable cover is attached to the sewing machine main body through the connection portion. By attaching the removable cover to the sewing machine main body, the sewing machine main body is covered with the removable cover. In the sewing machine having such a configuration, a space is formed around the sewing machine main body between the sewing machine main body and the removable cover. The space is an obstacle to free movement of an operator. Therefore, a user may be prevented from free movement while adjusting the sewing machine main body in a state where the removable cover is attached.Q: Arduino uploading to arduino.cc I want to try to upload an Arduino sketch to my Arduino clone. I tried uploading an example sketch to my Arduino clone using Arduino IDE. I then uploaded it using Arduino.cc and as soon as I click upload it starts uploading and does not stop until the Arduino is powered off. I have been Googling this for hours and can't find any solution for this. It would be great if someone had an idea why this is happening. The 82157476af
